

Using The “No-Bolt” Corner Clips With DUCTMATE® 25 & 35 SYSTEMS

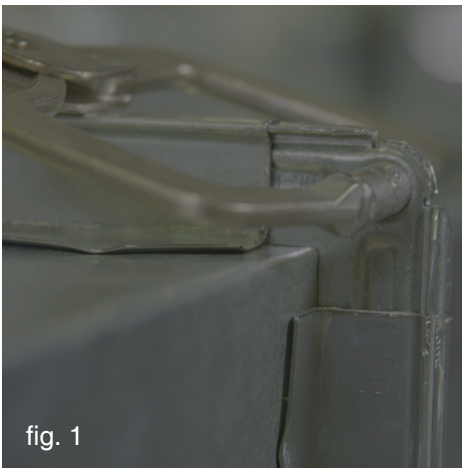

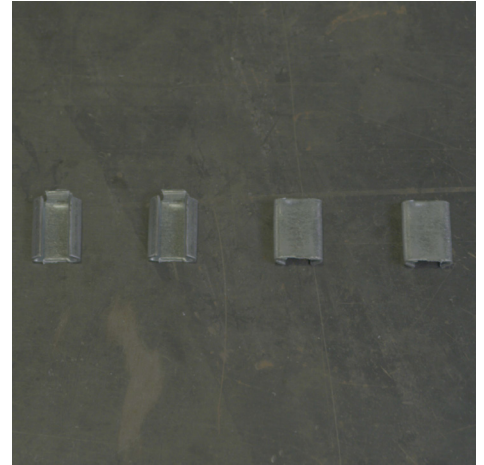

The “No-Bolt” Corner Piece provides you with the option of eliminating the bolt at each corner, saving the bolt cost, while maintaining and increasing the integrity of the Duct Connection.

The “No-Bolt” Corner Piece has a configuration on the outside corner to accept and permanently secure the Corner Clips.

It also retains the bolt hole should you decide to use bolts in any given situation.

The unique Corner Clip is formed from heavy gauge galvanized steel for a quick, strong, and better looking duct connection of uniform quality.

1 After aligning the duct joint as usual, use Ductmate Alignment Grips to secure the corner as shown in fig. 1.

Slide the Corner Clip onto the joined Corner Pieces, then tap with a hammer until the rear tab drops into the notch of the Corner Pieces. **2**

3 After verifying that the rear tab of the Corner Clip has engaged the lock notch of the Corner Pieces, repeat the process on the other legs of the Corner Pieces.

Repeat this process at each corner of the duct connection for a strong, aesthetically pleasing, permanent, and no-leak duct connection of uniform quality every time. **4**
